LAZIO CONSTRUCTION COMPANY SITE PLAN

DESCRIPTION

Lazio Construction Company deals in majorly construction work, drawing and interpreting building plans, Training students interested in construction as well as offering employment opportunities to those who may be in need of the potential opportunities. The major duties handled now is managing construction work, drawing building plans and interpreting them. The rest can follow.

It serves clients in the age bracket of 40 years and above. The admin should be in position of drafting the invoice to the clients and the client views only their invoice.

Location: Bbunga Uganda

CEO: Benard Mathew aka Lazio

Mission: To provide reliable and efficient construction services through expertise, innovation, and integrity.

- To offer professional training that equips students with hands-on skills in construction and design.

Vision: To be the leading construction company in the region—recognized for excellence in building, training, and empowering communities—while shaping a future where every structure inspires progress, safety, and pride.

Goal: To deliver innovative, sustainable, and high-quality construction solutions while nurturing skilled professionals and creating opportunities that transform lives and communities.

FUNCTIONAL REQUIREMENTS:

- ✓ **Admin dashboard** for registration of items, clients and also their credentials. We can also upload the pics and videos for company activities. Should be able to support the CRUD operations. We can as well view everything about our clients.

- ✓ **View area** which won't be restricted displaying the activities of the company.
- ✓ **Client view area** that will be displaying the invoice to the client as a table. Only accessed after logging in
- ✓ **Notification system** that displays the number of notifications the admin and the clients receive just in case.
- ✓ **Role based Access Control** where the user logs in and if is admin, redirected to admin dashboard, and if client, redirects to a page where they can only see their what concerns them.
- ✓ **Printing client invoice** in a PDF

STRUCTURES

- ✓ **Header** that displays the company logo, name and navigation (Home, Services & deliveries, Sign up and login)
- ✓ **Footer** showing the quick links, contacts, social media followings, about us (displays this in a modal) etc.
- ✓ **Home page** that displays the company logo in 3D animation, hero section with an eye-catching message, goal, vision and mission of the company some company activities in a slide show of pictures or videos in a card but attached to the button that when clicked can take us to the page with full details on all these, meet our leaders' section that displays the leader or leaders' picture and a carousel that when hovered displays details about the leader.
- ✓ The **View** page that displays the company activities and can be filtered by category.
- ✓ **Client View page** that displays the client's invoice in a table, button to print pdf.
- ✓ The admin dashboard with a side bar that can be toggled to hide or unhide to increase the field of view, main content area that displays the crucial statistics of the system by default then we can fetch other pages to display as inner HTML in it. The side bar should have parent and child buttons for a specific module or role. The dashboard should enable client registration, item registration, assigning login credentials, then then designing the client's voice.

  Invoice logic

- Fetch all the clients from the database then the admin can choose who they want.

TECHNOLOGIES

- Web technologies

CSS, HTML, JS, PHP, Bootstrap, AJAX, JQuery, JSON etc. We shall use SQL for database.

Host: Infinity free free tier, so avoid complex queries.
Ensure this is is very very responsive on mobile. We're to develop a web but do it as if we're developing for mobiles.

FLOW

A user lands to the home page, can view the things and can also view the services & Delivery page, then if they login, check roles if admin, we shall redirect to the admin page and if a client, we shall open the client page fetching content that belongs to only a particular client.

We shall store all the details we need from a client in a session and keep using the session.

After logging in, we shall have a welcome.php that we shall include to display a welcome message and the user's name. it can as well display a greeting message based on time like in morning display good morning and likewise in the afternoon and evening.

We shall have our headers and footer as html files and we include them using javascript.

We shall have one root css file cutting across all files apart from the header and the footer which will have their own styles but ensure they don't contradict.

Ensure the color is consistent across all pages and matches the age bracket served.

Lets make our front end really nice and attractive, easy to use, respecting all the principles of reusability.

We shall have one database.php file with the configurations using PDO and we shall store it in config folder and keep including it where we need to use it.

Notifications will be for only admin since our clients have only one page.

So each time, you provide the SQL as well. For the users table we shall have only have fields for user name and password, then use foreign keys to reference to people who are logging in.

When someone Is signing up, we can ask for their roles but fetching from the database since we shall use enum
